Skorokhod embedding problem

• Given

- $B = (B_t)_{t \ge 0}$ be a Brownian motion (BM) defined on $(\Omega, \mathbb{P}, \mathcal{F}, \mathbb{F} = (\mathcal{F}_t)_{t \ge 0})$;
- μ a centered probability distribution on \mathbb{R} .
- \bullet The Skorokhod embedding problem (SEP) aims to find an $\mathbb{F}\mathrm{-stopping}$ time τ s.t.
 - $B_{\tau\wedge\cdot} := (B_{\tau\wedge t})_{t\geq 0}$ is uniformly integrable (UI);
 - $B_{\tau} \sim \mu$.
- Two existing formulations exist in the literature :
 - "Strong" embedding : $\mathbb{F} = \mathbb{F}^B$;
 - "Weak" embedding : $\mathbb{F} \supset \mathbb{F}^{B}$.

"Optimal" embeddings

• A fruitful idea : compare the realization of a Brownian trajectory with the realization of some well-controlled process $(\phi_t(B))_{t\geq 0}$ and use the latter to decide when to stop the former :

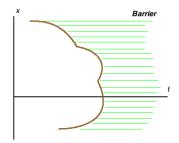

$$(B_t, t), (B_t, \sup_{s \le t} B_s), (B_t, L_t), \cdots$$

• Famous embeddings : Skorokhod, Root, Rost, Azéma-Yor, Jacka, Monroe, Vallois, Cox-Hobson, etc.

• A number of the above embeddings satisfy some particular "optimality".

A motivating example : Root's embedding (I)

• A Borel set $\mathcal{R} \subset \mathbb{R}_+ \times \mathbb{R}$ is called a barrier if $(s, x) \in \mathcal{R}$ and s < t implies $(t, x) \in \mathcal{R}$.

 \bullet There exists a barrier ${\mathcal R}$ s.t. the SEP is solved by the stopping time

$$au_{Root} := \inf \{t \in \mathbb{R}_+ : (t, B_t) \in \mathcal{R}\}.$$

A motivating example : Root's embedding (II)

• Let $\Phi : \mathbb{R}_+ \to \mathbb{R}$ be a strictly concave function, then the stopping time τ_{Root} solves the following optimization problem :

$$\sup_{\tau: \mu \text{-embedding}} \mathbb{E}[\Phi(\tau)] = \mathbb{E}[\Phi(\tau_{Root})].$$

Remark

- The strong and weak formulations are equivalent to study this optimization problem.
- The optimality of Root's embedding typically used the particular structure of Φ.
- What happened for a general $\Phi = \Phi((B_t)_{t \leq \tau}, \tau)$?

Probabilistic formulation of SEP (I)

- Let Ω be the space of continuous functions $\omega = (\omega_t)_{t \ge 0}$ s.t. $\omega_0 = 0$.
- Define the enlarged space $\overline{\Omega} := \Omega \times \mathbb{R}_+$ and denote by $\overline{\omega} = (\omega, \theta)$ its elements.
- Define the canonical element (B, T) by $B(\bar{\omega}) = \omega$ and $T(\bar{\omega}) = \theta$.
- \bullet Denote by $\overline{\mathbb{F}}=(\overline{\mathcal{F}}_t)_{t\geq 0}$ the canonical filtration given by

 $\overline{\mathcal{F}}_t \ := \ \sigma(B_s, s \le t) \lor \sigma\left(\{T \le s\} \text{ for all } s \in [0, t]\right).$

• In particular, T is an $\overline{\mathbb{F}}$ -stopping time.

Probabilistic formulation of SEP (II)

• Let $\overline{\mathcal{P}}$ be the set of probability measures $\overline{\mathbb{P}}$ on $\overline{\Omega}$ s.t. B is an $\overline{\mathbb{F}}$ -BM under $\overline{\mathbb{P}}$ and $B_{\mathcal{T}\wedge\cdot}$ is UI.

• Let μ be a zero-mean probability distribution on \mathbb{R} , i.e. $\mu(|x|) < +\infty$ and $\mu(x) = 0$. Here we denote for all measurable functions $\lambda : \mathbb{R} \to \mathbb{R}$

$$\mu(\lambda) := \int \lambda d\mu.$$

• Denote by $\overline{\mathcal{P}}(\mu) \subset \overline{\mathcal{P}}$ be the subset of measures $\overline{\mathbb{P}}$ s.t. $B_T \stackrel{\mathbb{P}}{\sim} \mu$.

Optimal SEP : Primal and dual problems (I)

• Let $\Phi:\overline\Omega\to\mathbb{R}$ be a measurable function. Φ is called non-anticipative if

$$\Phi(\omega, \theta) = \Phi(\omega_{\theta \wedge \cdot}, \theta) \text{ for all } (\omega, \theta) \in \overline{\Omega}.$$

• For a non-anticipative function Φ , the optimal SEP is defined by

$$P(\mu) := \sup_{\overline{\mathbb{P}}\in\overline{\mathcal{P}}(\mu)} \mathbb{E}^{\overline{\mathbb{P}}}[\Phi(B,T)].$$

• Let Λ be the space of continuous functions $\lambda:\mathbb{R}\to\mathbb{R}$ with linear growth.

• Let $\mathbb{F}^B = (\mathcal{F}^B_t)_{t \ge 0}$ be the natural filtration of B and \mathbb{P}_0 be the Wiener measure on Ω .

Optimal SEP : Primal and dual problems (II)

- \mathcal{H} the collection of all \mathbb{F} -predictable processes $H: \Omega \times \mathbb{R}_+ \to \mathbb{R}$ s.t.
 - $(H \cdot B) := \int_0^{\cdot} H_t dB_t$ is a \mathbb{P}_0- martingale;
 - $(H \cdot B)_t \ge -C(1+|B_t|)$ for some constant C > 0.
- Denote

$$\begin{aligned} \mathcal{D} &:= & \Big\{ (\lambda, H) \in \Lambda \times \mathcal{H} : \ \lambda(\omega_t) + (H \cdot B)_t \ \geq \ \Phi(\omega, t), \\ & \text{ for all } t \in \mathbb{R}_+ \text{ and } \mathbb{P}_0 \text{ - a.e.} \omega \in \Omega \Big\}. \end{aligned}$$

• The dual problem is given by

$$D(\mu) := \inf_{(\lambda,H)\in\mathcal{D}} \mu(\lambda).$$

(D) (A) (A) (A) (A)

Duality result

Theorem (GG & Tan & Touzi)

Assume that the non-anticipative function $\Phi : \overline{\Omega} \to \mathbb{R}$ is bounded from above, and $\theta \mapsto \Phi(\omega_{\theta_n \wedge \cdot}, \theta)$ is upper-semicontinuous for \mathbb{P}_0 a.e. $\omega \in \Omega$. Then there exists $\overline{\mathbb{P}}^* \in \overline{\mathcal{P}}(\mu)$ s.t.

$$\mathbb{E}^{\mathbb{P}^*} \left[\Phi(B, T) \right] = P(\mu) = D(\mu).$$

Remark

- In view of Dubins-Dambis-Schwarz's Theorem, the theorem above yields the Kantorovich duality for continuous martingale optimal transport problem.
- The duality allows to derive a geometric characterization of optimizers.

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

臣

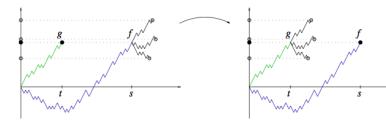

Stop-Go pair

• Let
$$\overline{\Omega}_+ := \{ \overline{\omega} = (\omega, \theta) \in \overline{\Omega} : \theta > 0 \}.$$

• $(\bar{\omega}, \bar{\omega}') \in \overline{\Omega} \times \overline{\Omega}$ is called a Stop-Go pair if $\omega_{\theta} = \omega'_{\theta'}$ and

 $\Phi(\bar{\omega}) \ + \ \Phi(\bar{\omega}'\otimes\bar{\omega}'') \ > \ \Phi(\bar{\omega}\otimes\bar{\omega}'') \ + \ \Phi(\bar{\omega}') \text{ for all } \bar{\omega}''\in\overline{\Omega}_+.$

 \bullet Denote by ${\rm SG}$ the set of Stop-Go pairs.

Monotonicity principle

• Let $\Gamma \subset \overline{\Omega},$ define

$$\Gamma^< \ := \ \left\{ (\omega, \theta) \in \overline{\Omega}: \ \exists \ (\omega', \theta') \in \Gamma \ \text{s.t.} \ \theta < \theta' \ \text{and} \ \omega_{\theta \wedge \cdot} = \omega'_{\theta \wedge \cdot} \right\}.$$

Theorem (Beiglböck & Cox & Huesmann, G. & Tan & Touzi)

Assume that the duality holds and let $\overline{\mathbb{P}}^*$ be an optimizer, then there is a Borel set $\Gamma \subset \overline{\Omega}$ s.t. $\overline{\mathbb{P}}^*(\Gamma) = 1$ and $\mathrm{SG} \cap (\Gamma^< \times \Gamma) = \emptyset$.

Remark

- Consider two paths (ω, θ) and (ω', θ') which end at the same level, i.e. ω_θ = ω'_{θ'}. We want to determine which of the two paths should be "stopped" and which one should be allowed to "go" on further.
- The condition $\omega_{\theta} = \omega'_{\theta'}$ is necessary to guarantee that a modified stopping rule still embeds the measure μ .

Back to Root's embedding

Theorem

Let $\overline{\mathbb{P}}^*$ be an optimizer, then there exists a barrier \mathcal{R} s.t.

$$T := \inf \{t \geq 0 : (t, B_t) \in \mathcal{R}\}, \overline{\mathbb{P}}^* - a.s.$$

Proof. Pick, by monotonicty principle, a set $\Gamma \subset \overline{\Omega}$ s.t. $\overline{\mathbb{P}}^*$ - almost surely, $(B, T) \in \Gamma$. By concavity of Φ , the set of Stop-Go pairs is given by

$$\mathrm{SG} \;\;=\;\; \left\{ \left((\omega, heta), (\omega', heta')
ight) : \; \omega_ heta = \omega_{ heta'}' \; ext{and} \; heta < heta'
ight\}.$$

As $SG \cap (\Gamma^{<} \times \Gamma) = \emptyset$, define the barrier by

$$\mathcal{R} \hspace{.1 in}:= \hspace{.1 in} \left\{ (t,x): \hspace{.1 in} \exists \hspace{.1 in} (\omega, heta) \in \mathsf{\Gamma} \hspace{.1 in} ext{s.t.} \hspace{.1 in} \omega_ heta = x \hspace{.1 in} ext{and} \hspace{.1 in} t < heta
ight\},$$

then · · ·

More remarks

• There exists a Borel set SG^* depending on $\overline{\mathbb{P}}^*$ s.t.

$$\mathrm{SG} \cap \left(\mathsf{\Gamma}^< \times \mathsf{\Gamma} \right) \ \subseteq \ \mathrm{SG}^* \cap \left(\mathsf{\Gamma}^< \times \mathsf{\Gamma} \right) \ = \ \emptyset.$$

• We may extend the analysis to multiple marginal case, i.e.

$$\begin{split} \overline{\Omega} &:= \ \Omega \times \mathbb{R}^m_+ \quad \text{and} \quad (B, \ T_1, \cdots, \ T_m) \\ \overline{\mathcal{P}}(\mu_1, \cdots, \mu_m) &:= \quad \left\{ \overline{\mathbb{P}} \in \overline{\mathcal{P}} : B_{T_k} \stackrel{\overline{\mathbb{P}}}{\sim} \mu_k \text{ for all } k = 1, \cdots, m \right\}. \end{split}$$
